DETAILED ACTION

Response to Arguments

 Applicant's arguments, filed 2/24/2009, with respect to Claims 2-5 have been fully considered and are persuasive, as the above claims were cancelled. The rejections therefore are withdrawn.

- 2. The terminal disclaimer filed on 2/24/2009 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of copending application 10/883,328 has been reviewed and is accepted. The terminal disclaimer has been recorded. As such the rejection of claims 1-3 and 6-11 in the grounds of nonstatutory double patenting over claim 3 of co-pending application 10/833328 in view of Fischell has been withdrawn.
- Applicant's arguments, filed 2/24/2009, with respect to the rejection(s) of claim(s)
 have been fully considered and are persuasive. Therefore, the rejections have been
 withdrawn.
 - a. Claims1-3 and 6-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Borges et al. (US 2005/0033417 A1) in view of Fischell et al. (US 2003/0065382 A1).
 - b. Claims 1-3, 6, 7, 9 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pacetti et al. (US 2002/0123801 A1) in view of Fischell et al. (US 2003/0065382 A1).

However, upon further consideration, a new ground(s) of rejection are made.

Application/Control Number: 10/796,397 Page 3

Art Unit: 1619

Claim Rejections - 35 USC § 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claims 1 and 6-11 are rejected under 35 U.S.C. 112, second paragraph, as

being indefinite for failing to particularly point out and distinctly claim the subject matter

which applicant regards as the invention. Claim 1 recited "the topotecan being present

in a concentration of about 75 nanometers, to about 300 nanometers," It is well

known to those in the art that concentration is not measured in length. After looking

through the instant specification. Examiner is interpreting the claims to read nanomolar

(nm) instead of nanometer.

Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148
 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

Application/Control Number: 10/796,397

Art Unit: 1619

1. Determining the scope and contents of the prior art.

Ascertaining the differences between the prior art and the claims at issue.

3. Resolving the level of ordinary skill in the pertinent art.

- Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 9. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- Claims 1 and 6-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Borges et al (US 2005/0033417), Fischell et al (US 2003/0065382), Eury et al (US 2002/0004679) and Shull et al (WO 96/34003).

Borges teaches coating an implantable medical device with a composition comprising a basecoat and a topcoat, wherein the basecoat includes at least one active agent that is incorporated into a first polymeric material, the basecoat is affixed to the surface of the medical device, and the topcoat contains a second polymeric material which is affixed to the basecoat for the purpose of controlling the elution rate of the at least one active agent (paragraph [0027]). Borges teaches a particular embodiment where the basecoat comprises a fluoropolymer and rapamycin and the topcoat comprises an acrylic polymer (paragraph [0030]). Borges also teaches the particular

Application/Control Number: 10/796,397

Art Unit: 1619

medical devices, stents, anastomosis devices and stent-grafts (abstract; paragraph [0032]). Borges further discusses drug combination therapy mainly for the treatment of restenosis and lists possible drugs that may be employed in the invention including rapamycin, cladribine and etoposide (paragraphs [0085]-[0087]).

Regarding claims 9-11, instant claims 9 requires the second polymeric material (an acrylic) to be incompatible with the first polymeric material (fluoropolymer), thereby creating both a physical and a chemical barrier to the elution of rapamycin and the topoisomerase inhibitor. The examiner takes the position that since Borges teaches a stent comprising a basecoat with a fluoropolymer and rapamycin and a topcoat comprising an acrylic, the creation of a chemical/physical barrier is an expected property of the stent of Borges, as the polymeric material is identical to the polymeric material in instant claims 10 and 11.

Borges is silent to the particular drug combination of rapamycin and a topoisomerase I inhibitor, specifically topotecan with a concentration of 75-100 nm.

Fischell teaches a stent that is coated with a composition comprising a polymer and one or more anti-restenosis drugs selected from the group consisting of a finite amount of particular drugs including topoisomerase I inhibitors including adriamycin etoposide, irinotecan and hycamptin (topotecan) as well as rapamycin (abstract; paragraphs [0020] and [0022]).

Eury teaches the use of topoisomerase inhibitors for the prevention of restenosis.

The method includes administering a topoisomerase inhibitor on a stent for local administration (Abstract). The topoisomerase inhibitor is selected from camptothecin,

Application/Control Number: 10/796,397

Art Unit: 1619

irinotecan and topotecan. In one embodiment the polymer stent is loaded with camptothecin, irinotecan or topotecan (Pg 1 [0015]). A second active agent can be coadministered with the topoisomerase inhibitor, such as Paclitaxel (Pg 1 [0017]), well known to those of ordinary skill in the art to aid in the prevention of restenosis (Pg 2 [0022]).

One of ordinary skill in the art would have been motivated to include any combination of the finite number of anti-restenosis drugs suggested by Fischell because they are all art-recognized equivalents used for the same purpose. All references teach coating an implantable medical device with a composition comprising anti-restenosis drugs, thus one skilled in the art would readily look to Fischell for other anti-restenosis drugs or combinations of anti-restenosis drugs. A practitioner would have reasonably expected a medical device coated with a sustained release coating comprising a combination of anti-restenosis drugs such as a topoisomerase I inhibitor, specifically topotecan, camptothecin or irinotecan as taught by Eury, and a rapamycin. Thus, in Borges, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the particular anti-restenosis drug combination of a rapamycin and a topoisomerase I inhibitor such as irinotecan or topotecan as suggested by Eury and Fischell.

11. Borges/Fischell/Eury fail to teach the specific concentration of topotecan recited. Shull teaches chemotherapeutic agents, such as camptothecin, being delivered in vivo to fight cancer growth in the body. For in vivo cell inhibition assays, camptothecin was found to have the following 50% cell growth inhibition concentration (Table 4) ranging

Art Unit: 1619

from 5.74 nm to about 3223.7nm depending on the cell line, It would have been prima facie obvious to one of skill in the art at the time the invention was made utilize topotecan in the concentrations taught by Shull dependent on the desired results. One of ordinary skill in the art would have been motivated to do so because topotecan and camptothecin are art-recognized equivalents, both topoisomerase I inhibitors, useful on polymeric stents for the treatment of restenosis, furthermore it would have been obvious to vary the concentration of topotecan used depending on the cell line looking to inhibit as Shull teaches that different cell lines require different concentration to achieve 50% inhibition.

Conclusion

No claims are allowable

12. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any

Art Unit: 1619

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jennifer A. Berríos whose telephone number is (571)270-7679. The examiner can normally be reached on Monday-Thursday: 7:00am-4:00pm (EST).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Woodward can be reached on (571) 272-8373. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
